PING TO TEST SERVER CONNECTIVITY USING SOCKETS

AIM:

To develop ping program to test server connectivity using sockets.

ALGORITHM:

Server.py

1. Import the socket package
2. Initialize local IP address and local port.
3. Create a socket using socket() function
4. Bind the IP address and port number.
5. Accept client request for connection.
6. Print the received connection details
7. Send reply message to the client.
8. Close the connection.

Client.py

1. Import the socket package
2. Initialize server IP address and local port.
3. Create a socket using socket() function.
4. Start the timer.
5. Send message to the server.
6. The reply message of the server is received.
7. The timer is stopped.
8. Print the round trip time statistics.

Ping to test server connectivity using sockets

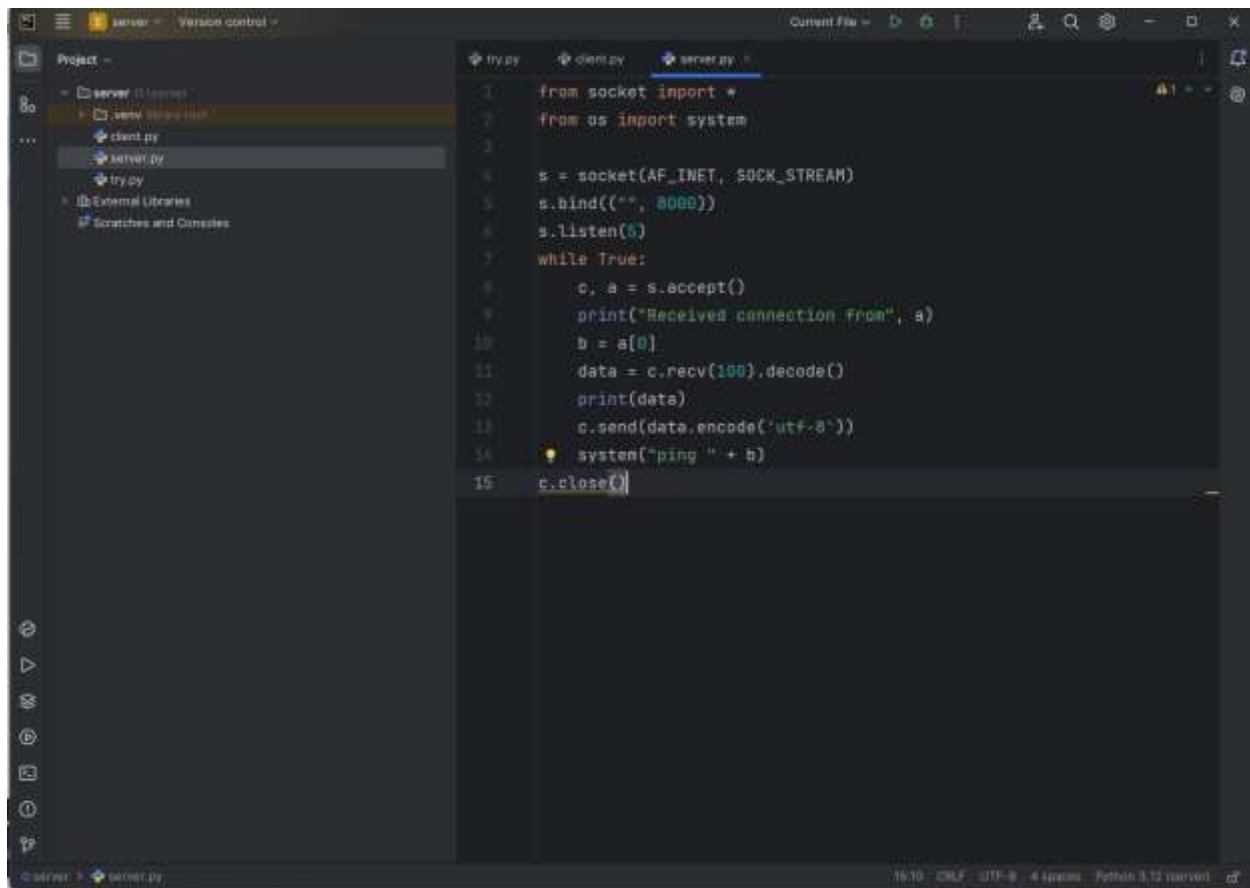

Client code:

```
from socket import *
from os import system
s = socket(AF_INET, SOCK_STREAM)
s.connect(("127.0.0.1",8000)) # Connect
op='connect'
```

```
s.send(op.encode('utf-8')) # Send request
data = s.recv(100).decode()# Get response
print(data)
system("ping "+ gethostname())
s.close()
```

#Server Code:

```
from socket import *
from os import system
s = socket(AF_INET,SOCK_STREAM)
s.bind(("",8000))
s.listen(5)
while True:
    c,a = s.accept()
    print("Received connection from", a)
    data=c.recv(100).decode()
    print(data)
    c.send(data.encode('utf-8'))
    system("ping "+ a)
c.close()
```

The image shows a screenshot of a code editor interface. On the left, a project explorer shows a folder named 'server' containing files 'client.py', 'server.py', and 'try.py'. The 'server.py' file is selected and its code is displayed in the main editor area. The code is a Python script for a simple server that listens on port 8000 and responds to incoming connections with a 'ping' message.

```
1 from socket import *
2 from os import system
3
4 s = socket(AF_INET, SOCK_STREAM)
5 s.bind(('', 8000))
6 s.listen(5)
7 while True:
8     c, a = s.accept()
9     print("Received connection from", a)
10    b = a[0]
11    data = c.recv(100).decode()
12    print(data)
13    c.send(data.encode('utf-8'))
14    system("ping " + b)
15 c.close()
```

Result:

Thus, the server connectivity is tested using Sockets experiment was done.
